WEAKER EXPRESSION ALSO DETECTED IN THE BRAIN AND ON THE SURFACE OF THE TONGUE.

-i- DEVELOPMENTAL STAGE: HIGHEST EXPRESSION WAS DETECTED IN DORSAL ROOT AND TRIGEMINAL GANGLIA BY EMBRYONIC DAY 14.5 AND CONTINUED THROUGH AT LEAST DAY 16.5.

-i- SIMILARITY: BELONGS TO THE VILLIN/GELSOLIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                STRAIN=NIH Swiss;

Natl. Acad. Sci. U.S.A. 99:984-989(2002).
-!- CATALYTIC ACTYUTY: ATP + L-tryptophan + tRNA(Trp) = AMP + diphosphate + L-tryptophanyl-tRNA(Trp).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Glucose-6-phosphate 1-dehydrogenase (EC 1.1.1.49) (G6PD) (Fragment).
ZW OR G6PD.
-!- PATHWAY: Caroténoid biosynthesis.
-!- SUBCELLULAR LOCATION: Chloroplast; chromoplast (By similarity).
-!- SIMILARITY: BELONGS TO THE LYCOPENE CYCLASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i- CATALYTIC ACTIVITY: D-glucose 6-phosphate + NADP(+) = D-glucose 1,5-lactone 6-phosphate + NADPH.
-i- PATHWAY: Pentose phosphate pathway; first step.
-i- SIMILARITY: BELONGS TO THE GLUCOSE-6-PHOSPHATE DEHYDROGENASE PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .,

Mol. Gen. Genet. 244:383-390(1994).
-!- FUNCTION: THIS METHYLASE RECOGNIZES THE DOUBLE-STRANDED SEQUENCE CRATCG, CAUSES SPECIFIC METHYLATION ON C-? ON BOTH STRANDS AND PROTECTS THE DNA FROM CLEAPAGE BY THE XORII ENDONUCLEASE.
-!- CATALYTIC ACTIVITY: 9-adenosyl-L-methionine + DNA cytosine = S-adenosyl-L-homocysteine + DNA 5-methylcycosine.
-!- SIMILARITY: BELONGS TO THE C5-METHYLTRANSFERASE FAMILY.

-!- CATALYTIC ACTIVITY: ATP + L-glutamate + tRNA(Glu) = AMP + diphosphate + L-glutamyl-tRNA(Glu).

-!- SUBJUNIT: Monomer (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic.

-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Science 293:498-506(2001).
-!- CATALYTIC ACTIVITY: ATP + L-glutamate + tRNA(Glu) = AMP +
diphosphate + L-glutamyl-tRNA(Glu).
-!- SUBUNIT: Monomer (By similarity).
-!- SUBUNIT: Monomer (Cytoplasmic.
-!- SUBCELIULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.

```
The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antiglem AFF4/CRBE-2 foot defined) and the polynucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising the compound, a method of immunotherapy comprising administering to a subject the antibody, an immuno effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antibod presenting coll that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune especially useful in gene therapy or as compounds. The compounds are useful for reating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for reating cancer, particularly covarian cancer. The compounds are useful for reating anniant stream to ancier. The compounds are useful for reating annibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polymuclectides are useful in diagnostic methods, for the detection and purification of antibodies, or as immunogens for the production of antibodies. The present sequence represents a human cancer and antibodies. The present sequence represents a human cancer and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respectively but have not been cross-referenced or CDS features put in due to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention provides a number of nucleotide and protein agequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium, coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Soryneform bacterium, and identifying a monoganic acids, particularly L-lysine. The present seacharides and organic acids, in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cancer antigen; ATF4; CREB-2; vaccine; cytostatic; immunogenic ligand; gene therapy; MHC; major histocompatibility complex; adoptive immunotherapy; cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                  Novel polymucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New therapeutic compounds comprising immunogenic ligands, useful for modulating an immune response, particularly for treating ovarian cancer, and as components of anticancer vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antispen Arra/CREB-2 (not defined) and the polynuclecides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising the subject the antibody. An immune effector cell that has central presenting cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a context of an MHC (major histocompatibility complex) molecule and a ceffector cell. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for treating cancer, particularly cacines. The compounds are useful for treating cancer, particularly covariant cancer. The compounds are also useful for generating antibodies that specifically recognise and bind to these molecules. These antibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polynuclecides are useful in classification of antibodies. The peptides, polypeptides and polynuclecides are useful in classification of antibodies. The percent in the production of antibodies. The present incomponents of the production of antibodies. The present immunogenic methods in the production of antibodies. The present immunogenic matuser antigen ATF4/CREB-2 based immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen ATE4/CREB-2 (not defined) and the polymuclectides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, an enthod of immunotherapy comprising administering to a subject the antibody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antibog presenting cell that presents the immunogenic compound in the context of an MHZ (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response to the synthetic and naturally occurring compounds are sepecially useful in gene therapy or as compounds. The compounds are specially useful in gene therapy or as compounds of anti-cancer vaccines. The compounds are useful for treating cancer, particularly covarian cancer. The compounds are useful for these molecules. These that specifically recognise and bind to these molecules. These cancer the compounds are larged the information of administered to a minimal cancer was an effected to a manner was an effected 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence represents a human cancer antigen ATF4/CREB-2 based immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respectively but have not been cross-referenced or CDS features put in due to the degeneracy of the DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           subject. The peptides, polypeptides and polynucleotides are useful in diagnostic methods, for the detection and purification of antibodies, or as immunogens for the production of antibodies. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
New therapeutic compounds comprising immunogenic ligands, useful for
                            for treating ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila, developmental biology, cell signalling, insecticide;

The present invention relates to novel human coding sequences

(ABQ99268-ABQ99608) and proteins (ABP64682-ABP65022). The sequences are

cueful in therapeutic, diagnostic and research methods. The

polynucleotides may be used in the field of molecular biology as

conversely the recombinant production of protein, or in generation of anti-sense

to the recombinant production of protein, or in generation of anti-sense

CC for the recombinant production of protein or in generation of anti-sense

DNA or RNA. The polynucleotides are useful in diagnostics as expressed

sequence tags (ESTs) for identifying expressed genes or for physical

mapping of the human genome. The proteins may be used as molecular weight

cmarkers, or as nutritional sources or supplements. The proteins may be

used to maintain and expand cell population in a totipotential or

cused to maintain and expand cell population in a totipotential or

puriporential state useful for re-engineering damaged or diseased

tissues, transplantation, manufacture of bio-pharmaceuticals or the

cyclophenial state useful for re-engineering damaged or diseased

tissues, transplantation, manufacture of bio-pharmaceuticals or the

cyclophenial proteins or mellorating disorders involving aberrant

contral/peripheral nervous system diseases, mechanical and traumatic

disorders, non-healing wounds, immune descinencies and disorders,

cinfectious diseases caused by viral, bacterial or fungal infection,

disorders, or cancer. The polynucleotide sequences of the invention were

assembled from ESTs isolated mainly by sequencing by hybridisation, and

cassembled from ESTs isolated mainly by sequencing by hybridisation, and

in some cases, sequences obtained from one or more public databases.

Note: The sequence data for this patent did not form part of the printed

The present invertions substantially purinted names in the present invertion users in the present invertion in Sabrol frame, ORFX, where X is 1-11491 process. In the specification). ABN15/52 to ABN27252 encode the human ORFX in the specification). ABN15/52 to ABN27252 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polymouclectide can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, to psoriasis, benigh tumnours, kebloid, degenerative disorders, lasenorthage, of transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disbetes mellitus, systemic cupus exryhematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious disease, autoimmune thyroiditis, myssthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, conceedion or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from cypothic damage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Blood, group, determinant, antigen, erythrocyte, oligosaccharide, glycoconjugate, glycosphingolipid, glycoprotein, glycosyltransferase,
                                                                                                                                                                                                                                                                 The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B phenotypes were associated with glycosyltransferases that converted the H substance associated with the O phenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2cal-betal-R. Hence, the primary products of the histo-blood group A and B genes are the respectively glycosyltransferases. This is a firagment of the A group transferase. See also AAR$6995-R57010.

                                           The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B phenotypes were associated with the O phenotype to A and B converted the substance associated with the O phenotype to A and B converted the substance associated with the O phenotype to A and B converted or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2Galberal-R. Hence, the primary products of the histo-blood group A and B genes are the respective glycosyltransferases. This is a firagment of the A group transferase. See also AARS6995-R57010. The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to phenotypes were associated with glycosyltransferases that converted the H substance associated with the Ophenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2Galbetal-R. Hence, the primary products of the histo-blood group A and B genes are the respective glycosyltransferases. The full (Updated on 25-MAR-2003 to correct PF field.)
